Siena 2005: Crystallographic Computing School

Content of the talk

➔ **Scientific Computing: Why Fortran?**

➔ **Crystallographic computing: CrysFML**

Programming paradigms for scientific applications (I)

➔ **Procedural, imperative structured programming (PP)**

Pascal, C, Fortran 77, …

➔ **Module-Oriented Programming (MOP)**

Fortran 95, ADA95, Modula-2, … Fortran 2003

➔ **Object oriented programming (OOP)**

C++, Java, Smalltalk, Eiffel, ADA95, …

Fortran 2003

Programming paradigms for scientific applications (II). Why Fortran?

Some reasons for developing in modern Fortran

➔ Simplicity and clarity of the syntax and the new facilities for global array manipulation. This is important for the common scientist that may write programs occasionally. This makes programming in **Fortran** more natural and problem solving oriented.

➔ Availability of many OOP features in modern **Fortran**: user-defined types, encapsulation, overload of procedures and functions. The lacking features (e.g. direct inheritance and class methods) are of less importance for scientific computing than those already available (all of them are available in **Fortran 2003**).

Programming paradigms for scientific applications (III). Why Fortran?

Some reasons for developing in modern Fortran

➔ The powerful implicit interface provided by encapsulating all functions and subroutines in *modules*, allowing to catch many errors at compile time, if one uses the *intent* attribute for procedure arguments. We may consider that Module Oriented Programming as an alternative/complement to OOP.

➔ Efficiency of the generated executable codes compared to C/C++ programs of similar complexity.

➔ Compatibility with legacy code and availability of a huge amount of free mathematical subroutines and functions. Re-usability of procedures written in **Fortran 77** was already a reality.

Programming paradigms for scientific applications (IV) . Why Fortran?

Some reasons for developing in modern Fortran

➔The new standard (published in November 2004): **Fortran 2003** contains all necessary features to perform pure OOP

➔John Reid, WG5 Convener: ***The new features of Fortran 2003***, PDF document available directly from the Internet: **ftp://ftp.nag.co.uk/sc22wg5/N1551-N1600/N1579.pdf**

➔To our knowledge **Fortran 2003** exist partially in NagF95, G95, in the new Lahey compiler for .NET, …

Existing Crystallographic Libraries (CCSL)

CCSL (Crystallographic Cambridge Subroutines Library)
J. Brown, J.C. Matthewmann
(W.I.F. David for powder diffraction)

⇒ The most complete set of procedures for crystallographic calculations. Well documented.

⇒ Written in Fortran 77 and with single crystal work in mind. Profuse use of commons. Difficult to adapt to modern programming techniques.

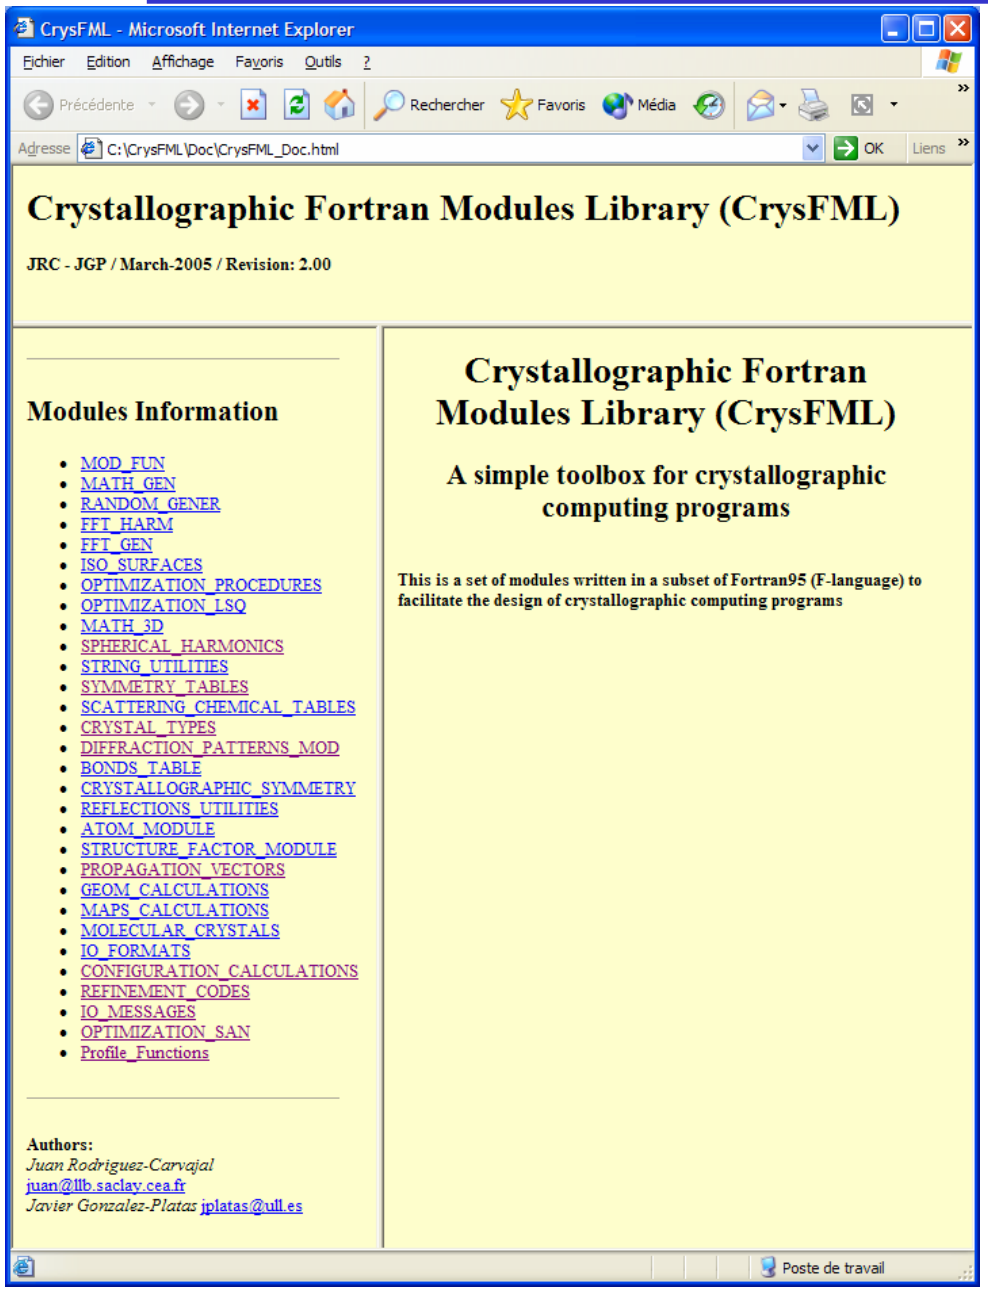
Existing Crystallographic Libraries (cctbx, Clipper)

Computational Crystallography Toolbox (cctbx)
R.W. Grosse-Kunstleve, P.D. Adams….

Clipper
Kevin Cowtan

⇒ Written in C++ and handled using Python scripts.

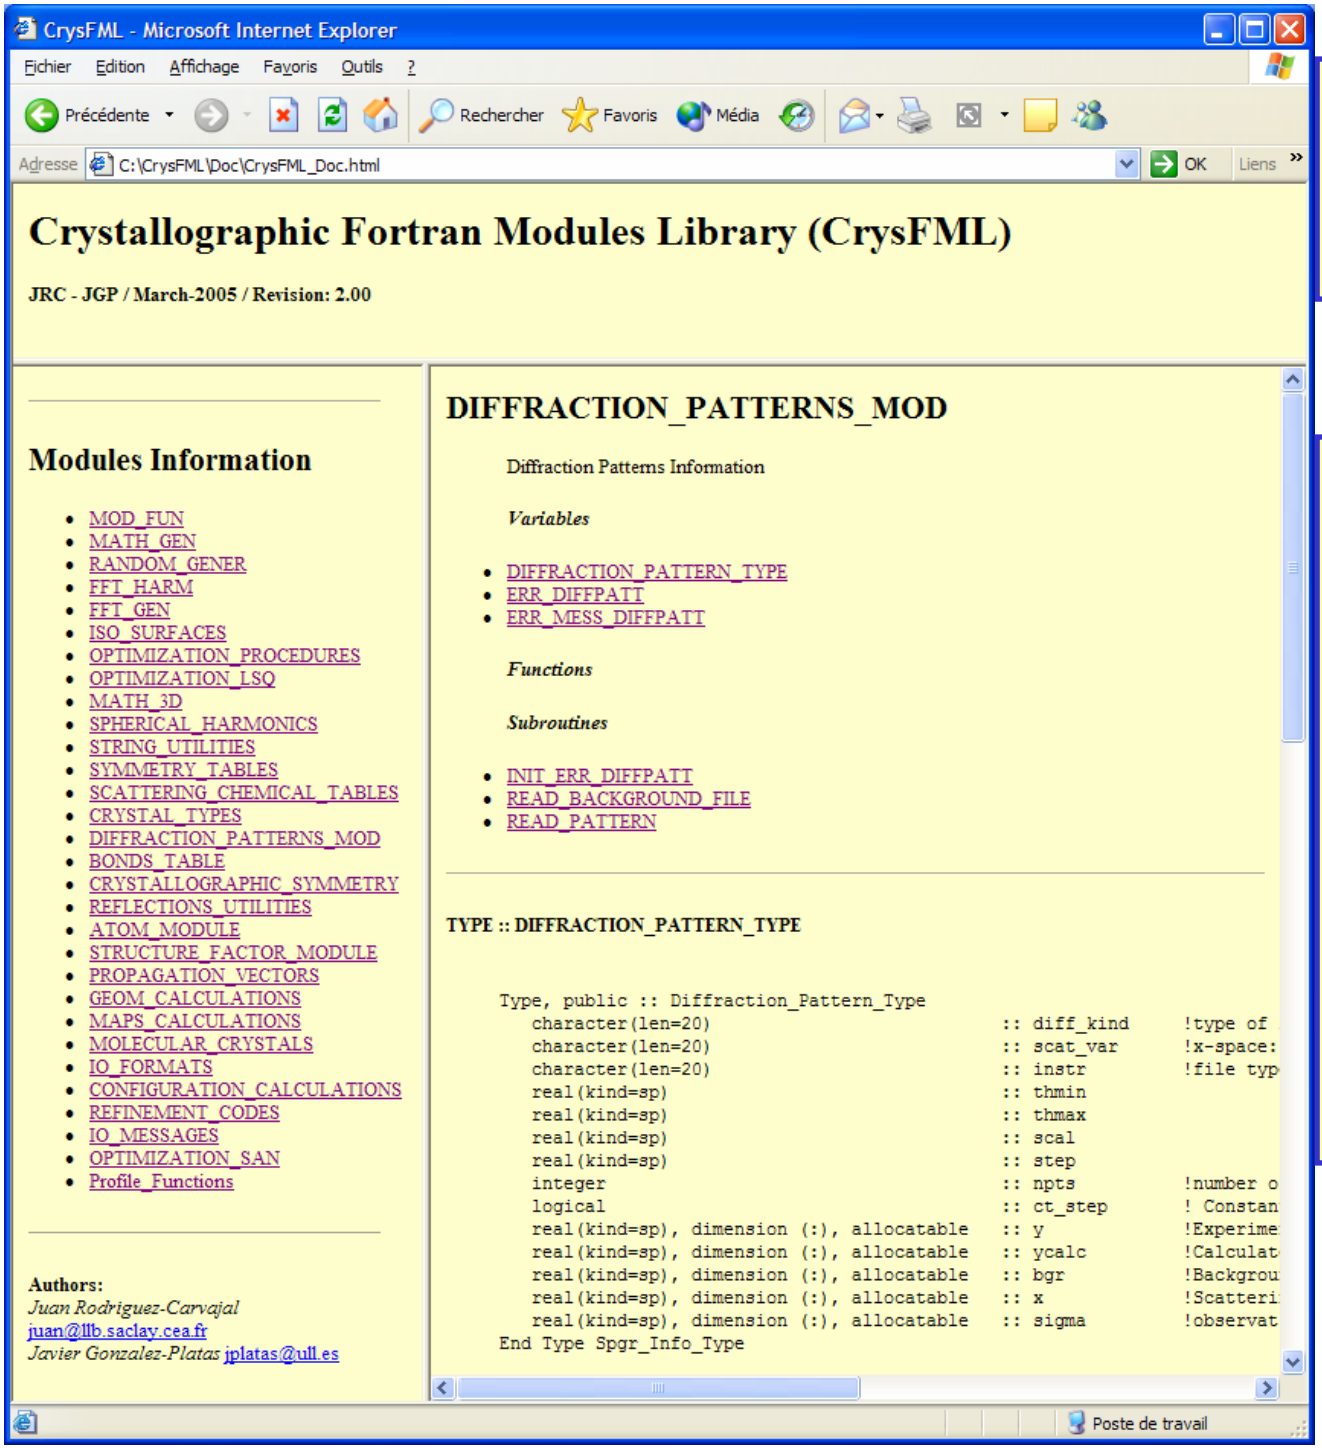
CrysFML: a collection of F-modules for crystallography



"Crystallographic Fortran Modules Library (CrysFML). A simple toolbox for crystallographic computing programs"

Commission on Crystallographic Computing, IUCr Newsletter No.1, pp 50-58, January 2003.

There are many other modules that are not ready for distribution:
Magnetism,
Cost_functions
Instrument descriptions (Four circles + large PSD)
Refinement codes for molecular crystals



CrysFML info

In some cases the information about a particular procedure doesn't appear, then goto the source code!

The reason: I didn't obey my own rules for documentation!

Developers of CrysFML/WinPLOTR/FullProf

Scope of CrysFML

We have developed a set of **Fortran 95 modules**, Crystallographic Fortran Modules Library (**CrysFML**), that may be **used** (in the Fortran 95 sense) in crystallographic and diffraction computing programs.

⇒ Modern array syntax and new features of Fortran 95 are used through the modules. In fact the whole library is written in **F-language**, a strict subset of Fortran 95 for which free compilers are available.

⇒ We take advantage of all object oriented programming (OOP) techniques already available in Fortran: user-defined types, encapsulation, overload (polymorphism) of procedures and functions. The lacking features (e.g. inheritance and class methods) will be easily implemented as soon as Fortran 2003 compilers become available.

⇒ Main programs using the adequate modules may perform more or less complicated calculations with only few lines of code.

F-language
(strict subset of Fortran 95)

All free F-compilers can be downloaded from the site:

ftp://ftp.swcp.com/~walt/pub/F

See also:

http://www.fortran.com/fortran/Imagine1

Free Fortran 95 compiler G95: strong development

All implementations of the G95-compiler (based in gcc) can be downloaded from the G95 home page:

http://www.g95.org

Platforms: Linux, Windows, Mac OS, Solaris, OpenBSD, etc…

Present status of CrysFML

⇒ The present **CrysFML** contains general and specific Mathematical modules (FFTs, geometrical calculations, optimizers, matrix operations). Procedures for reading files of many different formats, string utilities for handling free format, generation and reading of CIF files.

⇒ Modules for generating space groups from their Hermann-Mauguin or Hall symbols. Generic space groups with non-conventional lattice centring vectors can also be built using user-defined generators.

⇒ Reflection handling modules, including propagation vectors, may be used for generating reflections in selected regions of reciprocal space and for calculating structure factors.

⇒ The **documentation is written within the source code** using special comment symbols. A **document**, in **HTML format**, containing the description of all modules and procedures **can be generated** using a Fortran program (get_doc).

Present status of CrysFML

⇒ At present there is no formal way of distributing **CrysFML**, I can send copies (of the most stable modules) by e-mail to everyone wishing to use it.

⇒ There are parts of the library that are not completely developed so be patient and comprehensive.

⇒ The library is distributed with a set of working examples so that the user can mimic in order to create his (her) own programs.

Programs using CrysFML (I)

FullProf **:** Crystal and magnetic structure refinement, powder/single crystals, polarised neutrons, constant wavelength, TOF, energy dispersive, multiple patterns.

FOURIER, **GFOURIER** and **EdPCR**. These programs work on Windows and Linux and are already distributed from the LLB Web site.

BasIREPS: Program for calculating basis functions of irreducible representations of space groups. This program is useful for determining magnetic structures and phonon symmetry analysis.

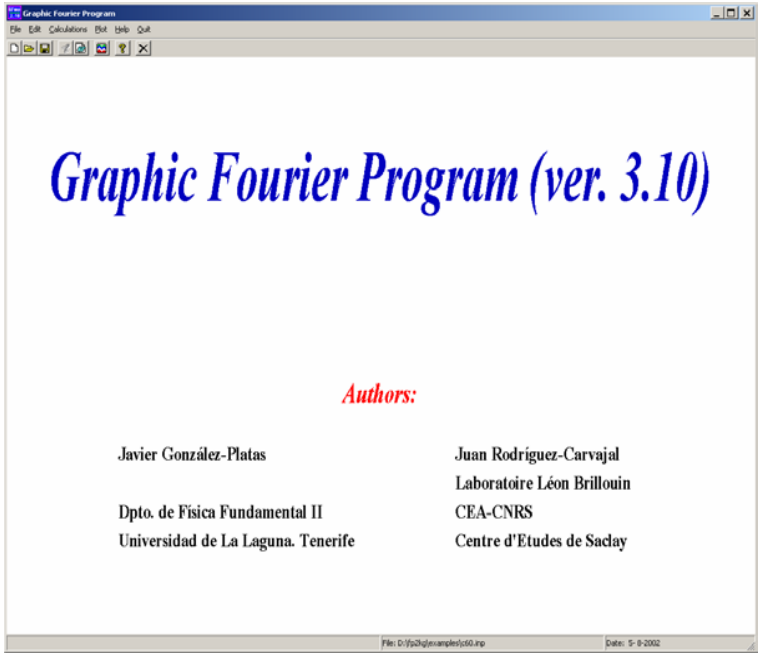
SIMBO: Program for the analysis of the magnetic topology of an arbitrary crystal structure. Generates a formal description of the Fourier transform of the exchange interactions to be used by other programs.

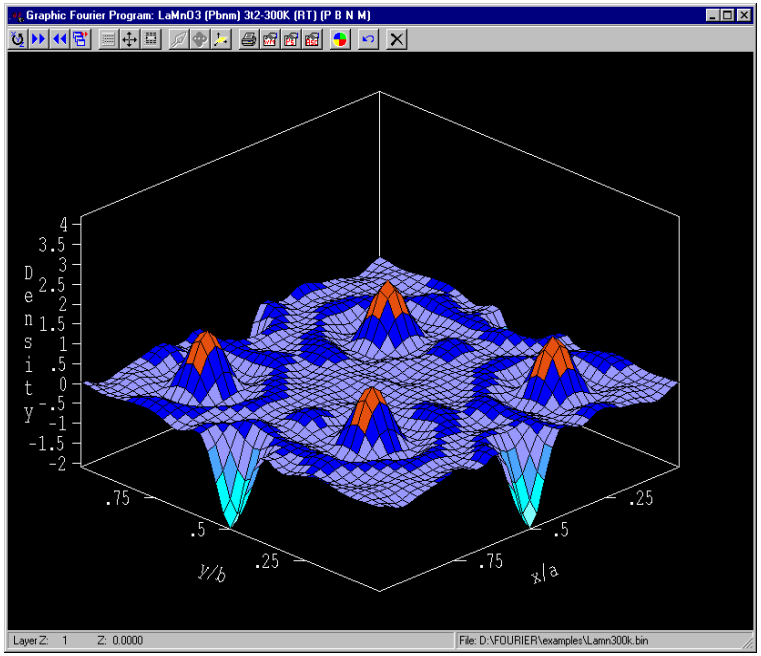
Programs using CrysFML (II)

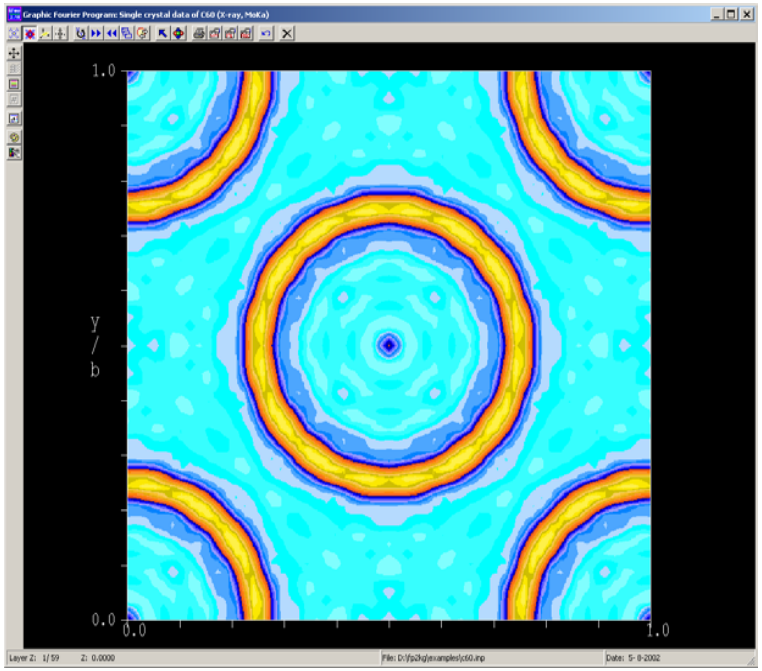
ENERMAG: Program to analyse the classical magnetic energy as a function of the exchange interactions and the point in the Brillouin Zone. This program can be used to generate theoretical magnetic phase diagrams in the J-space in order to get insight into the experimentally determined magnetic structures.

SIMILAR: Program to make conversion of settings for describing crystallographic structures. It determines automatically the splitting of Wyckoff positions on going from a space group to one of their subgroups. Calculate all the *translationengleiche* subgroups of a space group, co-set decompositions, etc.

DATARED: Program for data reduction of single crystal data. It handles twinning and incommensurate magnetic and crystal structures. Prepares files to be read by ***FullProf*** when using single crystals.







The programs Gfourier and Fourier are based in CrysFML

```
PROPAGATION VECTOR GROUP INFORMATION
====================================

=> The input propagation vector is: K=(  0.5000  0.5000  0.5000 )
=> K .. IS NOT .. equivalent to -K
=> The operators following the k-vectors constitute the co-set decomposition G[Gk]
   The list of equivalent k-vectors are also given on the right of operators.
=> The star of K is formed by the following   2 vectors:

        k_1  = (  0.5000  0.5000  0.5000 )    Op: (  1) x,y,z
                                              Op: (  3) x,-y,-z               -> (   0.5000 -0.5000 -0.5000 )
                                              Op: (  4) -x+1/2,-y,z+1/2       -> (  -0.5000 -0.5000  0.5000 )
                                              Op: (  7) -x+1/2,y,-z+1/2       -> (  -0.5000  0.5000 -0.5000 )
                                              Op: ( 10) y+3/4,-x+1/4,-z+3/4   -> (  -0.5000  0.5000 -0.5000 )
                                              Op: ( 13) -y+3/4,-x+1/4,z+3/4   -> (  -0.5000 -0.5000  0.5000 )
                                              Op: ( 14) -y+3/4,x+3/4,-z+1/4   -> (   0.5000 -0.5000 -0.5000 )
                                              Op: ( 16) y+3/4,x+3/4,z+1/4     -> (   0.5000  0.5000  0.5000 )

Eqv. -K: k_2  = (  0.5000 -0.5000  0.5000 )    Op: (  2) -y+1/4,x+3/4,z+1/4
                                              Op: (  5) y+1/4,x+3/4,-z+1/4    -> (   0.5000  0.5000 -0.5000 )
                                              Op: (  6) y+1/4,-x+1/4,z+3/4    -> (  -0.5000  0.5000  0.5000 )
                                              Op: (  8) -y+1/4,-x+1/4,-z+3/4  -> (  -0.5000 -0.5000 -0.5000 )
                                              Op: (  9) -x,-y,-z              -> (  -0.5000 -0.5000 -0.5000 )
                                              Op: ( 11) -x,y,z                -> (  -0.5000  0.5000  0.5000 )
                                              Op: ( 12) x+1/2,y,-z+1/2        -> (   0.5000  0.5000 -0.5000 )
                                              Op: ( 15) x+1/2,-y,z+1/2        -> (   0.5000 -0.5000  0.5000 )

=> G_k has the following symmetry operators:
     1 SYMM(  1) = x,y,z
     2 SYMM(  3) = x,-y,-z
     3 SYMM(  4) = -x+1/2,-y,z+1/2
     4 SYMM(  7) = -x+1/2,y,-z+1/2
```

Example of *BasIreps* output: *.bsr

```
 => Number of elements of G_k:   8
 => Number of irreducible representations of G_k:   2
 => Dimensions:  2 2

 => Symmetry elements of G_k and ireps:
    Symmetry elements reduced to the standard form (positive translations < 1)
    The matrices of IRreps have been multiplied by the appropriate phase factor
   . . . . . . . . . . . . . . . . . . . . . . . .
-> SYMM_K( 2):  -x+1/2,-y,z+1/2          :   2 ( 0, 0, z) ->  h4
    Phase factor for correcting input data:  0.0000
    Matrix of IRrep( 1):

Subroutine set_spacegroup(spacegen, spacegroup, gen, ngen, mode, force_hall)
character (len=*), intent(in) :: SpaceGen ! In -> String with Number, Hall
Type (Space_Group), intent(out) :: SpaceGroup ! Out -> SpaceGroup variable
character (len=*), dimension(7), intent(in), optional :: gen ! In -> String Generators
Integer, intent(in), optional :: ngen ! In -> Number of Generators
character (len=*), intent(in), optional :: Mode ! In -> HMS, Hall, Gen, Fix
character (len=*), intent(in), optional :: force_hall ! In -> f_hall (if present force
Subroutine that construct the object SpaceGroup from the H-M or Hall symbol. Expand the set of operators including centre of symmetry and non integer translations for centred cells. If the optional argument Gen is given, then Ngen and Mode="GEN" should be given. If the optional argument mode="HMS","HALL" is given the string in SpaceGen should correspond to the desired symbol. If Gen,NGen and Mode are not given but force_hall="f_hall" is given, the generation of the symmetry operators from the symbol of the space group is according to the Hall symbol even if the provided symbol is of Hermann-Maugin type.
Use: Symmetry_Tables -> Set_Spgr_Info
Use: String_Utilities -> Getnum, Ucase
Use: init_err_symm, Read_Xsym, Get_SO_from_FIX, Get_SO_from_Gener, Get_SO_from_Hall

My Computer

The procedure *Set_SpaceGroup*

```
Subroutine Set_Spacegroup(Spacegen,Spacegroup,Gen,Ngen,Mode,Force_Hall)
   !----Arguments ----!
   character (len=*),                  intent(in )            :: SpaceGen
   Type (Space_Group_Type),            intent(out)            :: SpaceGroup
   character (len=*), dimension(:),    intent(in ), optional  :: gen
   Integer,                            intent(in ), optional  :: ngen
   character (len=*),                  intent(in ), optional  :: Mode
   character (len=*),                  intent(in ), optional  :: force_hall
```

Header of the subroutine `Set_Spacegroup`. Only two arguments are needed in the most simple cases.

The string `Spacegen` may contain the Hermann-Mauguin (H-M) symbol, the Hall symbol or, simply, the number of the space group.

The object `Spacegroup` is provided by a call to the subroutine.

The procedure *Set_SpaceGroup*

One can make a call to the subroutine as follows:

```
! Declarations omitted

Ngen=3
Gen(1)="y,-x, z"
Gen(2)="-x,-y,-z"
Gen(3)="x+1/2, y+1/2, -z"
Call Set_Spacegroup(Spacegen,Spacegroup,Gen,Ngen,"GEN")
```

On output the object `Spacegroup` of type `Space_Group_type` is filled with all possible information obtained from the list of the given generators.

The procedure *Write_SpaceGroup*

```
!----------------------------------------
!  Example of simple program using CrysFML
!----------------------------------------
  Program Get_SPG_info
    use crystallographic_symmetry, only:  &
    space_group_type,set_spacegroup, write_spacegroup
    character(len=20)       :: spg_symb
    type(space_group_type)  :: SPG

    do
      write(unit=*,fmt="(a)",advance="no") &
      " => Please enter a space group (H-M/Hall/number): "
      read(unit=*,fmt="(a)") spg_symb
      if(len_trim(spg_symb) == 0) exit
      call set_spacegroup(spg_symb,SPG)
      call write_spacegroup(SPG,full=.true.)
    end do
    stop
  End Program Get_SPG_info
```

The procedure *Write_SpaceGroup*

The argument `full` in procedure `Write_SpaceGroup` means that all detailed information in asked to be output in the screen. One may change the instruction to write directly to an already opened file. For instance writing:

```
Call Write_SpaceGroup(SPG,iunit=3,full=.true.)
```

directs the output to the file connected with logical unit 3

Output of the small program: Get_SPG_info

DOS-shell - simple-a

```

Installing and compiling CrysFML using G95 in Windows

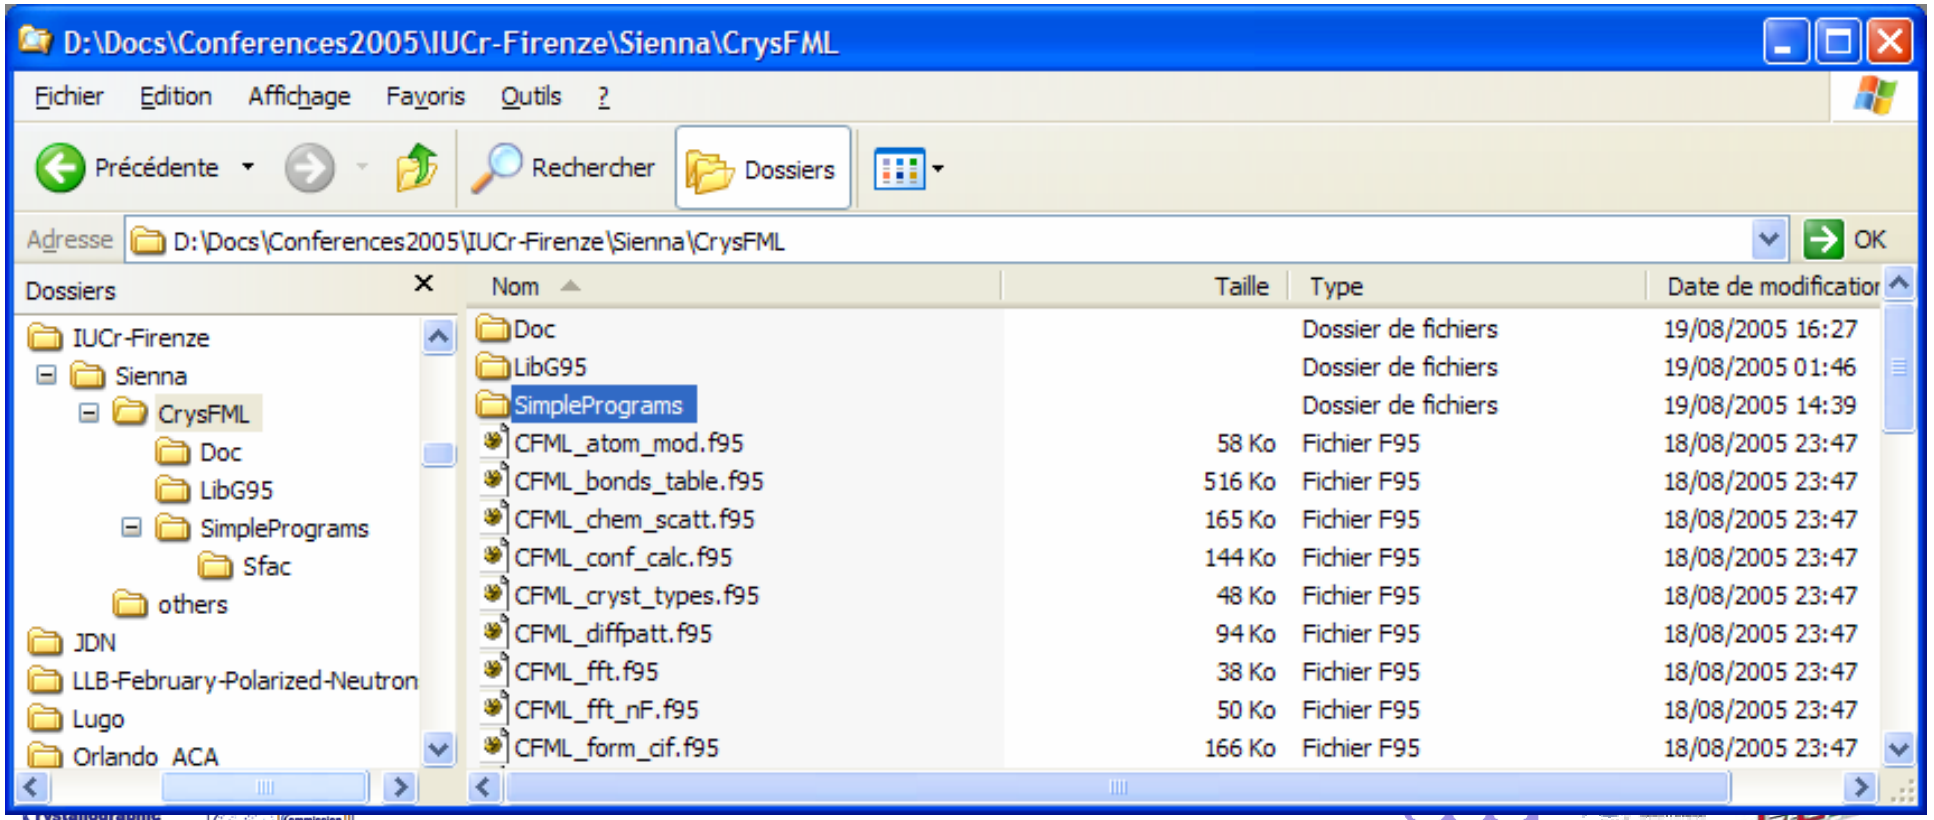
G95 in Windows using MinGW

Copy the file g95-MinGW.exe in a temporary directory and double-click on it: select the installation folder and say "yes" to all questions!
(e.g. c:\G95, … warning! do not use "Program Files")

-Create a directory called "CrysFML" (e.g. c:\CrysFML)
-Copy the file CrysFML_G95.zip in and extract all files respecting the directory structure
-Compile and build the library running the file "crysfml_g95.bat"

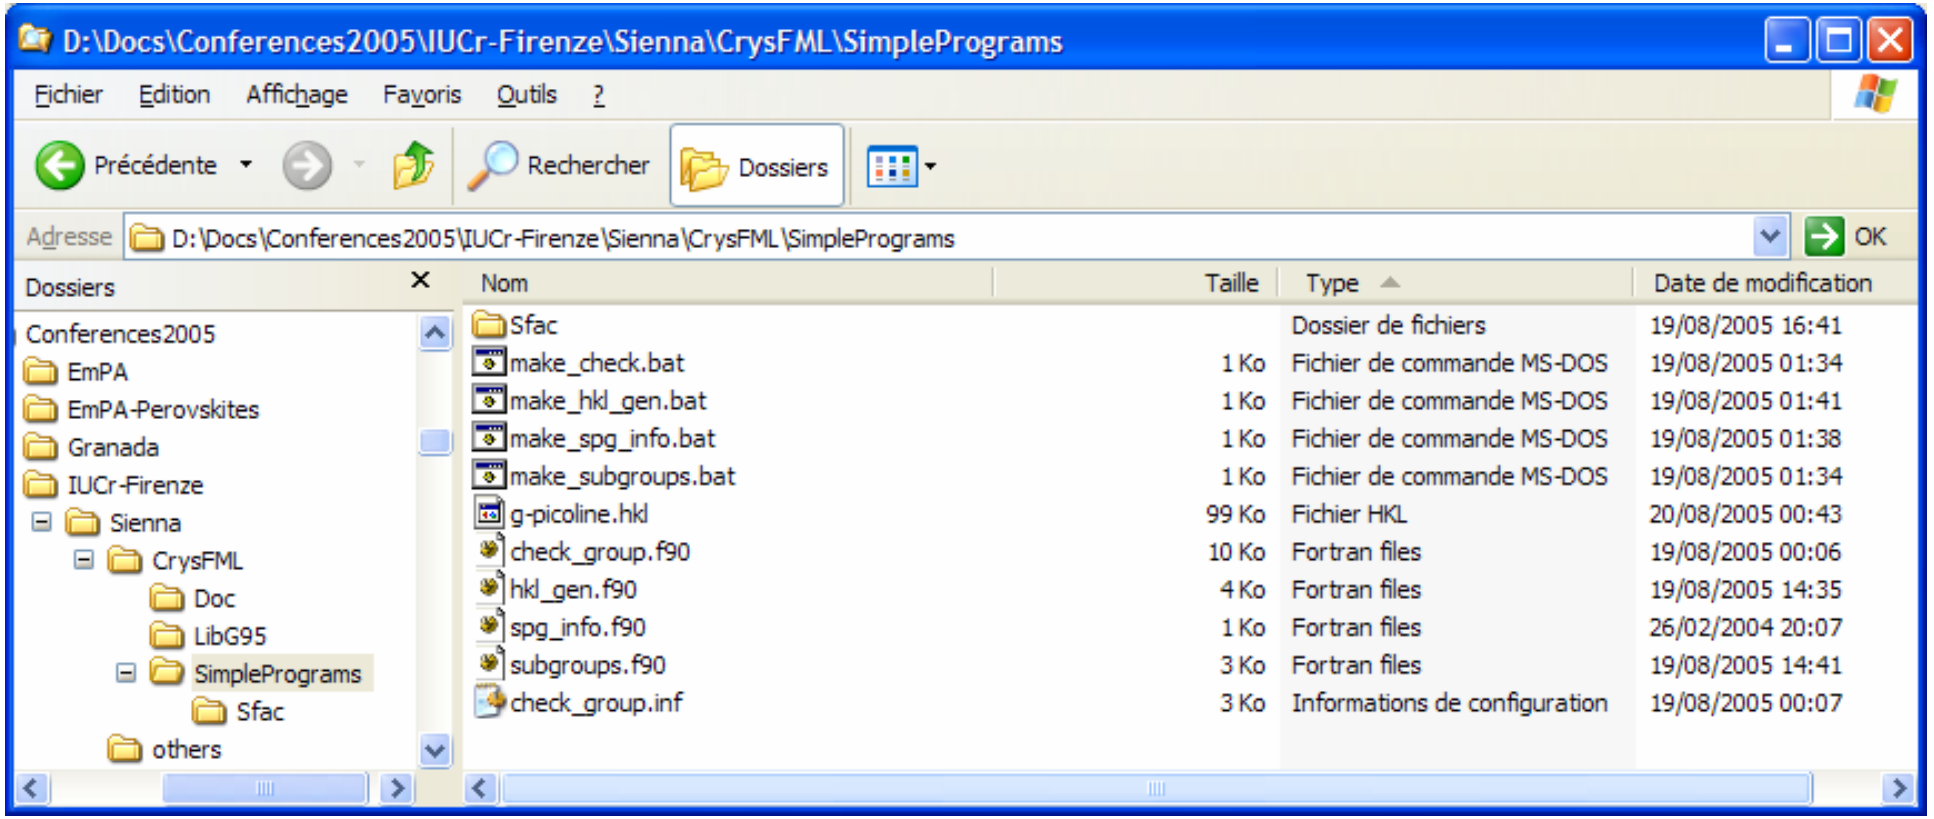
The content of the CrysFML folder and sub-folders

All CrysFML files start with the prefix "CFML_" and have extension .f95



Content of the "SimplePrograms" folder

Four main programs and make*.bat files, one *.hkl file coming from FullProf , a *.inf file and a sub-folder called "Sfac"



Content of the "Sfac" folder

Source code files:

There are two modules:
"observed_reflections" in file "observ.f90"
And
"cost_functions" in file "cost_functions.f90"

Three main programs:
"Calc_structure_factors" in "sfac_test.f90"
"Optimizing_structure" in "Optim_Sfac.f90"
"Optimizing_structure" in "Opt_restraints.f90"

Input files for CrysFML (CIF and CFL)
